Amendments to the Claims:

This listing of claims will replace all prior versions, and listing of claims in the application.

- 1. (Original) A method for structuring video by probabilistic merging of video segments, said method comprising the steps of:
 - a) obtaining a plurality of frames of unstructured video;
- b) generating video segments from the unstructured video by detecting shot boundaries based on color dissimilarity between consecutive frames;
- c) extracting a feature set by processing pairs of segments for visual dissimilarity and their temporal relationship, thereby generating an intersegment visual dissimilarity feature and an inter-segment temporal relationship feature; and
- d) merging video segments with a merging criterion that applies a probabilistic analysis to the feature set, thereby generating a merging sequence representing the video structure.
- 2. (Original) The method as claimed in claim 1 wherein step b) comprises the steps of:

generating color histograms

generating a difference signal from the color histograms that represents the color dissimilarity between consecutive frames; and

thresholding the difference signal based on a mean dissimilarity determined over a plurality of frames, thereby producing a signal that indicates an existence of a shot boundary.

- 3. (Original) The method as claimed in claim 2 wherein the difference signal is based on a mean dissimilarity determined over a plurality of frames centered on one of the consecutive frames and corresponding in number of frames to a fraction of the frame rate of video capture.
- 4. (Original) The method as claimed in claim 2 further including the step of morphologically transforming the thresholded difference signal with a

pair of structuring elements that eliminate the presence of multiple adjacent shot boundaries.

- 5. (Original) The method as claimed in claim 1 wherein the processing of pairs of segments for visual dissimilarity in step c) comprises the steps of computing a mean color histogram for each segment and computing a visual dissimilarity feature metric from the difference between mean color histograms for pairs of segments.
- 6. (Original) The method as claimed in claim 1 wherein the processing of pairs of segments for their temporal relationship in step c) comprises the processing of pairs of segments for a temporal separation between pairs of segments and for an accumulated temporal duration between pairs of segments.
- 7. (Currently Amended) The method as claimed in claim 1 wherein step d) comprises the steps of:

generating parametric mixture models to represent classconditional densities of the inter-segment features emprising of the feature set; and

applying the merging criterion to the parametric mixture models.

8. (Original) The method as claimed in claim 7 wherein step d) is performed in a hierarchical queue and comprises the steps of:

initializing the queue by introducing each feature into the queue with a priority equal to the probability of merging each corresponding pair of segments;

depleting the queue by merging the segments if the merging criterion is met; and

updating the model of the merged segment and then updating the queue based upon the updated model.

9. (Original) The method as claimed in claim 1 wherein representing the merging sequence is represented in a hierarchical tree structure.

10. (Currently Amended) A computer storage medium having instructions stored therein for causing a computer to perform the acts of:

generating video segments from unstructured video by detecting shot boundaries based on color dissimilarity between consecutive frames;

extracting a feature set by processing pairs of segments for visual dissimilarity and their temporal relationship, thereby generating an inter-segment visual dissimilarity feature and an inter-segment temporal relationship feature; and

merging video segments with a merging criterion that applies a probabilistic analysis to the feature set, thereby generating a merging sequence representing the video structure the method of claim 1.

- 11. (Original) A method for structuring video by probabilistic merging of video segments, said method comprising the steps of:
 - a) obtaining a plurality of frames of unstructured video;
- b) generating video segments from the unstructured video by detecting shot boundaries based on color dissimilarity between consecutive video frames;
- c) extracting a feature set by processing pairs of segments for visual dissimilarity and their temporal relationship, thereby generating an intersegment visual dissimilarity feature and an inter-segment temporal relationship feature;
- d) generating a parametric mixture model of the inter-segment features comprising the feature set; and
- e) merging video segments with a merging criterion that applies a probabilistic Bayesian analysis to the parametric mixture model, thereby generating a merging sequence representing the video structure.
- 12. (Original) The method as claimed in claim 11 wherein the processing of pairs of segments for visual dissimilarity in step c) comprises the steps of computing a mean color histogram for each segment and computing a visual dissimilarity feature metric from the difference between mean color histograms for pairs of segments.

- 13. (Original) The method as claimed in claim 11 wherein the processing of pairs of segments for their temporal relationship in step c) comprises the processing of pairs of segments for a temporal separation between pairs of segments and for an accumulated temporal duration between pairs of segments.
- 14. (Original) The method as claimed in claim 11 wherein the parametric mixture model generated in step d) represents class-conditional densities of the inter-segment features comprising the feature set.
- 15. (Original) The method as claimed in claim 11 wherein step e) is performed in a hierarchical queue and comprises the steps of:

initializing the queue by introducing each feature into the queue with a priority equal to the probability of merging each corresponding pair of segments;

depleting the queue by merging the segments if the merging criterion is met; and

updating the model of the merged segment and then updating the queue based upon the updated model.

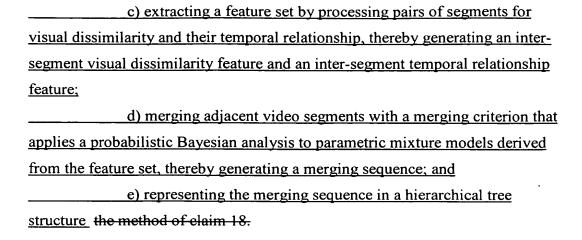

- 16. (Original) The method as claimed in claim 11 wherein the merging sequence is represented in a hierarchical tree structure that includes a frame extracted from each segment and displayed at each node of the tree.
- 17. (Currently Amended) A computer storage medium having instructions stored therein for causing a computer to perform <u>acts for structuring</u> video by probabilistic merging of video segments, the acts including:

obtaining a plurality of frames of unstructured video;

generating video segments from the unstructured video by detecting shot boundaries based on color dissimilarity between consecutive video frames;

extracting a feature set by processing pairs of segments for visual dissimilarity and their temporal relationship, thereby generating an inter-segment visual dissimilarity feature and an inter-segment temporal relationship feature;

generating a parametric mixture model of the inter-segment features comprising the feature set; and merging video segments with a merging criterion that applies a probabilistic Bayesian analysis to the parametric mixture model, thereby generating a merging sequence representing the video structure the method of claim 11. 18. (Original) A method for structuring video by probabilistic merging of video segments, said method comprising the steps of: a) obtaining a plurality of frames of unstructured video; b) generating video segments from the unstructured video by detecting shot boundaries based on color dissimilarity between consecutive video frames: c) extracting a feature set by processing pairs of segments for visual dissimilarity and their temporal relationship, thereby generating an intersegment visual dissimilarity feature and an inter-segment temporal relationship feature; d) merging adjacent video segments with a merging criterion that applies a probabilistic Bayesian analysis to parametric mixture models derived from the feature set, thereby generating a merging sequence; and e) representing the merging sequence in a hierarchical tree structure. 19. (Original) The method as claimed in claim 18 wherein representing the merging sequence in a hierarchical tree structure includes displaying a frame extracted from each segment. 20. (Currently Amended) A computer storage medium having instructions stored therein for causing a computer to perform probabilistic merging of video segments, said instructions performing the acts of: a) obtaining a plurality of frames of unstructured video; b) generating video segments from the unstructured video by detecting shot boundaries based on color dissimilarity between consecutive video frames;

21. (New) A method for structuring video by probabilistic merging of video segments, said method comprising:

generating video segments from an unstructured plurality of video frames by detecting shot boundaries based on color dissimilarity between consecutive frames;

extracting a feature set by processing pairs of the video segments for visual dissimilarity and processing pairs of segments to determine temporal separation; and

merging the video segments with a merging criterion that applies a probabilistic analysis to the feature set, thereby generating a merging sequence representing the video structure, the merging independent of any empirical parameter determination; and

generating a hierarchy with the merged video segments, the hierarchy having a merging sequence represented by a binary partition tree.

22. (New) The method as claimed in claim 21 wherein the merging the video segments includes maximizing the a posteriori probability mass function of a binary random variable that represents inter-segment features of the video segments.
